Keypoints

- A boolean expression in SQL is used to determine if something is true or false.

- A boolean expression can be used to check conditions such as if a department is equal to a certain value or if a salary is greater than a certain amount.

- When using a boolean expression, it will return either true or false for each row in the table.

- Boolean expressions can be combined with other conditions to create more complex queries.

- Boolean expressions can be applied to any column in a table, such as first name, last name, department, or salary.
