Keypoints

1. The create database command is used to create a new database in SQL.

2. The use command is used to select and start using a specific database.

3. The drop database command is used to remove a database from the list of databases.

4. SQL keywords have special meaning and are displayed in blue, while identifiers do not have special meaning and are displayed in black.

5. It is recommended to use capital letters for SQL keywords and lowercase for identifiers to improve readability.

6. The create and drop commands have additional functionality for creating tables and views.

7. The refresh button in the object browser can be used to update the list of databases.

8. Terminating SQL statements with a semicolon is necessary to execute the command.

9. The output section displays the result of executing SQL commands, including any affected rows.

10. Subscribing to the channel is recommended for more tutorials on SQL.
